

SOIL BUILDER PLUS

WINTER ANNUAL COVER CROP COCKTAIL/HIGH-YIELDING FORAGE

A mix of TriCal 815 Triticale, crimson clover, hairy vetch, MOI & KB Supreme Annual Ryegrass, and daikon radish. An excellent spring forage and/or overwintering cover crop. Can also be used for wildlife food plots. Clovers and vetch provide protein in a forage application, and triticale and ryegrass contribute effective fiber and bulk. This mix is ideal for a spring grazing or cutting when the triticale reaches flag leaf or boot stage.

As a cover crop mix, each species contributes a soil improvement function. Daikon radish will be the shortest-lived species. Its deep tap root grows quickly in the fall and scavenges nitrogen, holding it in its tissues. The large taproot also breaks through compacted layers of soil. As the radish winter-kills (in colder areas), its decomposing tissue gradually releases nutrients that were scavenged at deeper levels early in the fall with its rapidly growing tap root. These nutrients (especially nitrogen) may have otherwise been leached. As these nutrients are re-released by the decomposing radish, the slower growing over-wintering grass and legume species in the mix carry them forward to spring.

The combination of species anchors soil and provides weed suppression with its diverse canopy, also protecting soil from erosion over winter. The mixture of diverse over-wintering root structures also builds soil organic matter and feeds soil microbes, contributing to long-term soil health and fertility.

Grazing Application -

If planted in late summer, it can be grazed in fall and early winter. In northern locations, earlier planting dates may be needed for this to be successful. The daikon radish leaves provide good grazing at this point, and may winterkill, while the rest of the species in the mix can over-winter and be grazed the following spring.

If planted in early spring, the winter triticale will typically not vernalize, and therefore will not form a viable head. If spring planted, this should also be ready to graze in about 65 to 70 days depending on growing conditions, though yield may not be as high with the crop getting fewer days of growth. This depends heavily on region and USDA growing zone.

At A Glance

- A versatile winter annual cover crop or forage mix with soil health benefits.
- Can be grazed in fall or spring with timely planting.
- Can be used for a wildlife food plot

Product Formula

- 66.7% TriCal 815 Triticale
- 11.7% Crimson Clover
- 10.0% Hairy Vetch
- 10.0% Annual Ryegrass
- 1.5% Daikon Radish

Best Uses

Haylage, baleage, grazing, cover crop

Establishment

Seeding Rate: 120-140 lbs/A as a forage
60-90 lbs/A as a cover crop

Seeding Depth: 1/2—3/4". Large box

Seeding Dates: Early fall (about 1 month before wheat planting dates) or early spring.
